## For FM transmitters in grounded cathode circuit

Ordering code Q51-X2032
Coaxial metal-ceramic tetrode, forced-air-cooled, particularly suitable for FM transmitters in grounded cathode circuit. For an easy design of the tuned circuit the control grid terminal is coaxially led out within the cathode terminals. A direct dc blocking of the screen grid produced by the external cathode terminal is thereby possible. This arrangement of the terminals also prevents cross coupling of the input and output circuit against the common cathode line inductance. An increased stability against self-excitation has been achieved by integrating an attenuator into the screen grid line. This resistor consumes a power of approximately 30 W for an operating frequency of 110 MHz and an output power of 12 kW .

(1) Handle, swingable
(2) Taphole for tube fuse RöSich7
(3) Do not use as terminal
(4) Free for anode support

Approx. weight $6,7 \mathrm{~kg}$
The radiator and the terminals are of concentric design with the following diameters:

| Radiator | $\varnothing 173,5$ | Control grid terminal | $\varnothing 30,6$ |
| :--- | :--- | :--- | :--- |
| Anode terminal | $\varnothing 103,0$ | Heater/cathode terminal | $\varnothing 74,6$ |
| Screen grid terminal | $\varnothing 96,6$ | Heater terminal | $\varnothing 52,5$ |

## Heating

| Heater voltage | $U_{F}$ <br> Heater current <br> Heating: direct <br> Cathode: thoriated tungsten | I | V |
| :--- | :--- | :--- | :--- |

## Characteristics

| Emission current at $U_{\mathrm{A}}=U_{\mathrm{G} 2}=U_{\mathrm{G} 1}=300 \mathrm{~V}$ | $I_{\mathrm{em}}$ | 35 | A |
| :--- | :--- | :--- | :--- |
| Amplification factor of screen grid <br> at $U_{\mathrm{A}}=2 \mathrm{kV}, U_{\mathrm{G} 2}=600$ to $1000 \mathrm{~V}, I_{\mathrm{A}}=2 \mathrm{~A}$ | $\mu_{\mathrm{g} 2 \mathrm{~g} 1}$ | 8,0 |  |
| Transconductance <br> at $U_{\mathrm{A}}=2 \mathrm{kV}, U_{\mathrm{G} 2}=800 \mathrm{~V}, I_{\mathrm{A}}=1,5$ bis $2,5 \mathrm{~A}$ | s | 53 | $\mathrm{~mA} / \mathrm{V}$ |

## Capacitances

| Cathode/control grid | $c_{\mathrm{kg} 1}$ | $\approx 95$ | pF |
| :--- | :--- | :--- | :--- |
| Cathode/screen grid | $c_{\mathrm{kg} 2}$ | $\approx 45$ | pF |
| Cathode/anode | $c_{\mathrm{ka}}$ | $\approx 0,04$ | $\left.\mathrm{pF}^{1}\right)$ |
| Control grid/screen grid | $c_{\mathrm{g} 1 \mathrm{~g} 2}$ | $\approx 76$ | pF |
| Control grid/anode | $c_{\mathrm{g} 1 \mathrm{a}}$ | $\approx 0,32$ | $\mathrm{pF} 1)$ |
| Screen grid/anode | $c_{\mathrm{g} 2 \mathrm{a}}$ | $\approx 22$ | pF |

Accessories

## Tube mounting

Axis vertical, anode up or down.
The cavity TK 4470 is available for tube operation in the VHF range (accessories).

## Maximum tube surface temperature

The metal-ceramic seals of the tube must not exceed a temperature $220^{\circ} \mathrm{C}$ at any point, except of the centrally located control grid terminal, the temperature of which must not exceed $280^{\circ} \mathrm{C}$. These requirements can only be met without additional cooling of the terminals if an appropriate air duct and sufficient space between the individual contact springs is provided so that enough cooling air can pass through.

## Forced-air cooling

The minimum air flow rate required for maximum anode dissipation is given in the cooling air diagram valid for $25^{\circ} \mathrm{C}$ inlet temperature at a normal air pressure of 1 bar (sea level). The cooling air must be supplied from the side of the electrode terminals. For further information on forced air cooling refer to "Explanations on Technical Data".

## Safety precautions

The section "Safety precautions" under "Explanations on Technical Data" describes how the tube is to be protected against damage due to electric overload or insufficient cooling. A copper wire with $0,20 \mathrm{~mm}$ diameter should be used to test the anode overcurrent trip circuit.
For protection against thermal anode overload the tube fuse RöSich7 is recommended. In conjunction with pull switch RöKt11 it disconnects the voltages at the tube in case of overload (accessories).

## Cooling air diagram

The cooling air is supplied from the electrode terminal side.
Air pressure $=1$ bar
$t_{1}=25^{\circ} \mathrm{C}$

[^0]:    1) Measured by means of a 50 cm diameter screening plate in the screen grid terminal plane.
[^1]:    1) Circuit losses are not included.
    2) For zero signal dc anode current $I_{\mathrm{A} O}=0,4 \mathrm{~A}$.
    3) Additional loss in the grid circuit is not taken into consideration.
