## TIX $2195:$ R.F. FOETER TETRODE

The 7495 is a nine pin all glass construction beani tetrode for use in V.Fi.F. amplifier and driver applications.

The use of a special rugeed electrode construction manufactured by means of semi-autonatic assembly techniques contributes to a low catastrophic failure rate.

The cathode sleeve is nade of a special alloy to inhibit the Erorth of cathode interface resistance during long periods of operation under cut-off conditions and the pure tungsten heater has been desigened to withstand frequent heater sritching (see note). In addition, the heater cathode construction and naterials ensure very low levels of leokage. throughout life.

The glass base and envelope strain patteris are tightly controlled during manufacture to prevent glass failures durine life. Special attention is also given to the control or materials and processes to aininise variation of characteristics durina life. A particular feature is the very low thange in inter-electrode capacitances during life.

Note: A sample fron each production lot is tested under the following elevated conditions to assess heater quality:- heater voltage $120 \%$ of noninal value: heater-cathode voltage 240 V r.a.s: applied voltages cycled 1 minute on, 3 minutes off for 100 hours.

## MECIANICAL DATA

Coated unipotential cathode.
Outline drawing ................. 6-3 Bulb ..................... T-6 $6 \frac{1}{2}$
Base ..............................79-1 Snell button ......... 9pin

Moximun overall length ....................................................... $2^{\frac{5}{6}}{ }^{3}$ "
Maximut seated height . ................................................... $2 \frac{3}{8}$
Pin comections .................... Basing .................. 9 K
Pin 1 -Anode Pin 6-Gric No. 2

Pin 2 - Internal connection
Pin 7 - Cathode
Pin 3 - Grid No. 3
Pin 8 - Grid No. 1
Pin 4-Heater Pin 9-GridINo. 1
Pin 5 - Heator
Mountine position
any
Maximum shock (intermittent service) ............................ 500E.

## ELECTRICAL DATA

Interelectrode capacitances. (Measured without extermal shield)

C out ......................................................................... 4.5 pF
Heater:

RANGE OF CHARACTERISTIC VALUES FOR EQUIPUENT DESIGN. (At Zero hours)
Test conditions $\ldots \ldots . \mathrm{V}_{\mathrm{a}}=250 \mathrm{~V}, \mathrm{~V}_{\mathrm{g} 3}=0, \mathrm{~V}_{\mathrm{g} 2}=250 \mathrm{~V}, \mathrm{~V}_{\mathrm{g} 1}=-7.5 \mathrm{~V}$. Min. Bogey. Max.

| Anode current | 33 | 45 | 57 | mA |
| :--- | :---: | :---: | ---: | :--- |
| Soreen current | - | - | 7.0 | mA |
| Mutual conductance | 5.6 | 7.0 | 9.0 | $\mathrm{~mA} / \mathrm{V}$ |
| Anode current at $V_{g 1}=-15 \mathrm{~V}$ |  |  | 15 | mA |
| Amplification factor |  | 13 | 16 | 20 |

Maximum value of cathode interface resistance throughout life under cut-off conditions.................................................... 103.
