

AMPEREX TUBE TYPE 7854

TENTATIVE DATA

The Amperex 7854 is a twin, four-electrode tube designed for use as a radio frequency power amplifier, oscillator, modulator and frequency multiplier. Each anode is capable of dissipating 30 watts. The cathode is indirectly heated, oxide coated. Maximum ratings apply up to 175 mc. At reduced ratings it may be operated up to 500 mc. The tube has built-in cross-neutralizing capacitors, the values of which are adjusted to be equal to the direct grid-plate capacities. This insures neutralization over the entire operating band. The plate characteristics of the 7854 are identical to the Amperex tube type 5894.

GENERAL CHARACTERISTICS

MECHANICAL

Mounting Position	Vertical, base up or down Horizontal with anode pins in any plane, horizontal plane preferred.
Maximum Glass and Seal Temperatures ¹	250°C
Accessories	
Socket	Johnson 122-105 or equal
Net Weight, Approx.	2.5 ounces

ELECTRICAL

	<u>Min.</u>	<u>Bogey</u>	<u>Max</u>
Heater Voltage			
Series	11.4	12.6	13.8 volts
Parallel	5.7	6.3	6.9 volts

Grid to Plate	---	0.06	0.09 μ uf
Input	6.7	9.4	11.6 μ uf
Output	2.1	2.6	3.7 μ uf

¹ When operating the tube at maximum ratings, with forced air cooling, it is necessary to cool both the lateral bulb surface as well as the plate pin seals by directing the flow of air toward the top and sides of the bulb. In most cases approximately 20 cfm is sufficient. At reduced ratings, the use of a heat sink is permissible. However, regardless of the type of cooling being used, the degree of cooling should be determined by direct temperature measurement of both the seals and the bulb.

The temperature may be measured by means of temperature sensitive compounds such as Tempolad, made by the Tempil Corp., New York, N.Y.
